How common are injuries from heavy truck accidents?

An accident involving a heavy truck, 18-wheeler, semi, big tractor-trailer truck, often results in death or serious injury. The statistics are shocking. Over 1 million people were involved in nearly 500,000 large truck related accidents in 1999. That resulted in over 5,000 deaths and over 140,000 injuries. Of those injuries from heavy truck accidents, 10's of thousands involved severe brain damage or the loss of limb. Some trucks weigh over 100,000 lbs when fully loaded. Unloaded, they still weigh over 10,000 lbs. That is 5-10 times the weight of a car.

This problem of heavy truck accidents has been around for years, and the data is consistent over time. For example, according to the Safety Board analysis of Fatal Accident Reporting System (FARS), in 1993 there were 3,311 heavy trucks involved in 3,169 fatal accidents, in which 3,783 persons died. The FARS report shows that heavy truck accidents are often caused by truckdriver fatigue. In fact, as many as 30 to 40 percent of all heavy truck accidents are caused by fatiuge of the driver.

What is the cost to society of heavy truck accidents?

Injuries and fatalities are not the only toll inflicted by heavy truck crashes. For example, the financial toll that goes along with such crashes impacts commerce, costs of insurance, costs of health care, and costs of good. The NTSB reports that the actual cost of all heavy truck accidets in 1999 was \$34 billion.

What is the most likely cause of heavy truck accidents?

The NTSB said, "Because of the significant number of heavy truck-related fatalities and the significant role of fatigue in such accidents, the Board initiated this study of single-vehicle heavy truck accidents to examine the role of specific factors, such as drivers' patterns of duty and sleep, in fatigue-related heavy truck accidents and to determine potential remedial actions. The purpose of the Board's study was to examine the factors that affect driver fatigue and not the statistical incidence of fatigue.

Therefore, the Board specifically selected truck accidents that were likely to include fatigue-related accidents; that is, single-vehicle accidents that tend to occur at night. The Board desired to obtain approximately an equal number of fatigue-related and nonfatigue-related accidents through its notification process."

The most common causes of heavy trucks accidents are:

- speeding,
- running off the road
- travel out lane
- failure to yield

But at the root of those causes of heavy truck accidents is often driver fatigue.

"The Safety Board investigated 113 single-vehicle heavy truck accidents in which the driver survived. However, because the 96-hour duty/sleep history that was required for the study was not available for 6 drivers, the 6 accidents in which these drivers were involved were not included in the study. The study, therefore, analyzes data from 107 single-vehicle heavy truck accidents."

Based on the results of the analysis, the NTSB determined that fatigue is a key factor in heavy truck accidents, that hours of service regulations are a key to preventing heavy truck accidents, that improved education of heavy-truck drivers is important in implementing improved safety about fatigue,

How is the cause of a heavy truck accident determined?

- Inspect the heavy truck including mechanics, tires, brakes
- Interview witnesses
- Review police reports
- Obtain weather report and determine driving conditions

What to do if you were in a heavy truck accident?

When a person is injured or killed in a heavy truck accident they may be able to hold the driver and heavy trucking company responsible, as well as the companies on whose behalf a delivery is being made. The damages may include:

- Wrongful death
- Physical pain and suffering, mental anguish and physical impairment;
- Medical and hospital expenses
- Wage loss and lost earning capacity

Online Resources about Truck Accident Litigation
